Attention: Mr. Terry Shim

Dear Sirs:

Re: 6460 Main Street Stouffville Water Balance
Town of Whitchurch-Stouffville, York Region
Our File 22002.00

GAMAN Consultants Inc. is pleased to submit this hydrogeological report undertaken to address Town of Whitchurch-Stouffville (TWS) Peer Review Comment 1.12 by Burnside Associates dated March 4, 2021. The results of the water balance evaluation show a deficit in infiltration after development, and this is common with developments. However, this area of Stouffville is situated within a groundwater discharge area and this should preclude the need to mitigate infiltration. In our opinion, recharge mitigation is not required for the site.

Yours truly,
GAMAN Consultants Inc.

Gary R. Hendy, P.Eng.
Consulting Engineer

1.0 INTRODUCTION

1.1 BACKGROUND

GAMAN Consultants Inc. was retained by the 2426009 Ontario Ltd. to complete a water balance evaluation. The evaluation was undertaken to address Town of Whitchurch-Stouffville (TWS) Peer Review Comment 1.12 by Burnside Associates dated March 4, 2021 to complete a water balance for the site.

By way of background, Soil-Engineers completed a geotechnical investigation of the site and documented the results in a report dated June 2017. The report was peer reviewed by Burnside Associates on behalf of the TWS. Groundwater levels in the original boreholes provided mixed results and Burnside requested additional groundwater monitoring be undertaken to address anomalies in groundwater levels. This issue was addressed in a separate letter report by GAMAN Consultants on the groundwater monitoring dated April 19, 2023.

This report evaluates the pre-development and post-development runoff and infiltration rates to determine the changes in runoff and recharge before and after development. The deficit in recharge from this evaluation is then integrated with stormwater management systems of the site to maintain recharge to the groundwater table, where feasible.

The site is located at 6460 Main Street Figures 1 and 2 in the Town of Whitchurch-Stouffville.

1.2 STUDY OBJECTIVES & SCOPE

The Conservation Authorities Geoscience Group developed guidelines for hydrogeological assessment submissions related to water balances. The document provides information for consultants to consider and address in technical submissions for a development site. The

purpose of this evaluation was to assess the changes in recharge to the site for input into appropriate mitigation methods to be implemented to maintain groundwater recharge.

The tasks required to complete the work program included:

- Background review of the physical setting of the site including physiography, surficial geology and groundwater.
- A site inspection of the site and surrounding area.
- Groundwater monitoring using boreholes installed by other project team members.
- A review of local water well records and existing services around the site.
- Preparation of a hydrogeological report to address Conservation Authority Guidelines for a water balance.

This report documents the study findings of these investigations.

2.0 PHYSICAL SETTING

2.1 PHYSIOGRAPHY, SURFICIAL GEOLOGY AND DRAINAGE

The site is situated within the Oak Ridges Moraine (ORM) and South Slope Physiographic Regions as described by Chapman and Putnam (1984). The ORM is a hummocky ridge of stratified drift. This ridge was deposited between the Ontario and Simcoe Lobes of the retreating Wisconsinan ice sheet thousands of years ago. The kame moraines associated with the ORM are illustrated at the north side of the study area, see Figure 3. The ORM forms a drainage basin divide between Georgian Bay and Lake Ontario.

The South Slope Physiographic Region consists of a broad, gently sloping plain of finer grained sediments deposited by the Ontario Lobe of the receding Wisconsinan Glacier.

The drumlinized till plain is associated with the Halton Till that caps the ORM within the vicinity of the site. The till is commonly comprised of clayey silt to silt.

Drainage is towards Stouffville Creek which conveys surface water south to southeast and eventually discharges into Reesor Creek near Markham.

2.2 HYDROGEOLOGY

Aquifers are sources of groundwater yielding enough water to supply a well. Aquifers are commonly derived from saturated sand and/or gravel deposits within overburden and also from fractured bedrock. Aquitards are barriers to groundwater movement and can provide protection to aquifers from sources of contamination. Aquitards are commonly comprised of silt, clay, till or bedrock. Figure 4 is a stratigraphic cross section from west to east through the site. The section was created from the Oak Ridges Moraine Groundwater Program (ORMGP) site and extends from just west of Woodbine Avenue to Warden Avenue.

The upper four stratigraphic (hydrogeologic) units include:

- The Halton Till or equivalent (aquitard)
- The Oak Ridges Moraine (aquifer)
- The Newmarket Till (aquitard)
- The Thorncliffe Formation (aquifer).

The Oak Ridges Moraine is a source of groundwater for municipal, communal and individual wells and is referred to as the Oak Ridges Aquifer Complex (ORAC). It is a major recharge area for deeper aquifers and a source of recharge for the headwaters to many streams originating on or down hill of the Moraine. The ORAC is exposed at surface north of the site as shown in Figure 4.

The Newmarket (Till) Aquitard protects or buffers deeper sources of groundwater from contamination. The aquitard separates the ORAC from deeper aquifers. Figure 4 shows different parts of the Newmarket Till; however, they collectively behave as an aquitard.

The Thorncliffe Formation is an aquifer where its composition is comprised of coarser deposits of saturated sand and/or gravel. Locally, the Thorncliffe Aquifer Complex (TAC) is a source of groundwater to municipal, communal and individual wells in the vicinity of Aurora, Newmarket and the Town of Whitchurch-Stouffville. The aquifer is not shown in the cross-section, but it would appear immediately below the Newmarket Aquitard.

2.3 LOCAL WATER SUPPLIES

Figure 5 illustrates the location of water wells in the vicinity of the site. There are no known domestic wells within 500 metres of the site. The wells appearing on Figure 5 within 500 metres of the site are commonly geotechnical boreholes less than six (6) metres deep or test holes likely from municipal groundwater exploration programs given the references to test holes (TH). Wells extending to bedrock are documented with the total well depth in metres.

The absence of domestic wells near the site was expected because Stouffville is serviced with municipal wells. In this regard, the proposed development site is located outside the well head protection area.

3.0 SITE INVESTIGATIONS

3.1 SHALLOW SUBSURFACE SOILS

Soil Engineers monitored the drilling and installation of geotechnical boreholes at the site. The boreholes logs are included in Appendix B.

Shallows soils are comprised mostly of clayey-silt and silt down to about six (6) metres below grade. The locations of the boreholes appear in Figure 2.

3.2 SHALLOW GROUNDWATER MOVEMENT

Shallow groundwater movement is a reflection of local topography and drainage. The overall direction of shallow groundwater movement is southward through the site at a regional scale. This is reasonably consistent with local topography and drainage at the site that is generally northward.

The three boreholes are shown on Figure 2 and designated BH22-1, BH22-2 and BH22-3.

Groundwater level monitoring began in early March 2022 and continued to June 2022. The groundwater monitor construction details and water level results are documented in Tables B-1 and B-2, Appendix B respectively. Figure 2 illustrates the interpreted direction of shallow groundwater movement from north to south beneath the site.

Monitor BH22-3 shows deeper groundwater levels in the range of 1.5 to 1.7 metres below grade. It is assumed the deeper groundwater levels at this location may be influenced by underground services along Main Street that drain the groundwater table, creating a local cone of depression perpendicular to the service trench beneath the road. The effects of high groundwater levels on construction were addressed by the Soil-Engineers 2017 Geotechnical Investigations. These supplemental groundwater levels should be incorporated into the design of structures at the site.

4.0 WATER BUDGET

4.1 CLIMATIC DATA

As precipitation falls to the ground in the form of rainfall or snow, it is subject to components of the hydrological cycle. Water will generally runoff, infiltrate, evaporate or be subject to transpiration from plant uptake. Evaporation and transpiration are commonly grouped together as evapotranspiration while runoff and infiltration are grouped together as water surplus. The water budget is represented in a simple form as follows:

Water In = water Out

P + EI = ET + IR + RO + EO

Where:

P = Precipitation

EI = External Inputs (Run-on, irrigation and vertical/lateral transfers)

ET = Evapotranspiration from plant uptake and evaporation.

IR = Infiltration Recharge

RO = Run-off

EO = External Outputs (water taking and vertical/lateral transfers)

Thornthwaite (1948) developed a mathematical method for analyzing precipitation data and calculating evapotranspiration and water surplus. The method was modified by Thornthwaite-Mather in 1957 and was used to evaluate water surplus. Average monthly temperature and precipitation data were analyzed using this method and the results are presented in Table C-1. The 30-year normal annual precipitation for Buttonville Airport is 821.5 mm/yr. with a resultant moisture surplus of 207.9 m/yr.

4.2 GROUNDWATER RECHARGE ESTIMATES

4.2.1 MECP Recharge Rates

The MOEE Hydrogeological Technical Information Requirements for Land Development Applications (1995) includes Table 2 derived from hydrologic analysis for assessing peak runoff for storm water management. The method considers topography, soil type and vegetation cover at a site. Table C-2 documents the infiltration factors for pre-development and post-development at the site.

Topography was evaluated using topographic information from the site with an average slope of about 2.2% or 22 metres per kilometre. The site reflects steep slopes with a topographic factor of 0.1 for pre-development as shown in Table C-2. Site grading usually makes the slopes gentler than the original topography. The gentler the slope, the higher the infiltration factor and higher the recharge rate post-development. Grading is unlikely to change the overall slope factor; therefore, we assumed the topographic infiltration factor remains at 0.1 and continues to reflect steep slopes after grading.

Cover reflects the presence or absence of a canopy that can shade parts of the site and reduce evaporation. The site in its pre-development state is a mixture of trees and shrubs consistent with a cover factor of 0.15. Much of the site may be cleared post development and we have assumed a value of 0.1 for post development.

The pre-development total infiltration factor presented in Table C-2 is 0.4. Pre-development recharge rate for the site is the product of the infiltration factor (0.4) times the water surplus (208 mm/year) and results in an annual recharge rate of 73 mm/year. This seems reasonable for a site comprised of silt/clay deposits.

4.2.2 ORMGP Recharge Rates

The Oak Ridges Moraine Groundwater Program was used as a guide for evaluating recharge rates. We reviewed the recharge model for the area and presented the information

in Figure 6. The recharge rates within various blocks (or cells) in the figure show wide ranging recharge rates ranging from about 4 to 68 mm/yr. The site recharge rate presented in Section 4.2.1 was calculated at 73 mm/year is higher than the regional scale model of recharge rates in the ORMGP.

In summary the pre-development recharge rate was calculated at 73 mm/year, and this is conservative compared with the recharge rates documented in the ORMGP.

4.3 PRE-DEVELOPMENT & POST-DEVELOPMENT WATER BUDGETS

The existing lands are open space. There are no impermeable surfaces at the site and the soils have been shown to be comprised of silty-clayey deposits. We have examined runoff and infiltration for the pre-development conditions of the site based on water budget information presented in previous sections. Table C-3 documents the runoff and recharge rates for the pre-development and post-development scenarios.

The pre-development recharge rate for the undeveloped lands was calculated at 179 m^3/year based on a recharge rate of 73 mm/year. Runoff is much higher at 333 m^3/year.

Sources of recharge for post-development include natural infiltration on landscaped areas of the site. The permeable areas of the site are small and comprise 911m^2. The total infiltration post-development is estimated at 66 m^3/year. Table C-3 documents a recharge deficit of 113 m^3/year for the site.

4.4 MITIGATION

Low impact development (LID) systems are used to capture runoff and promote infiltration as a means of restoring recharge. LID provides a wide range of practices that off-set the negative impacts of urban stormwater runoff including the reduction of groundwater

recharge. Geology and water levels are two of the most important factors used to assess the suitability of a site for LID measures.

The site is overlain with fine-textured silty to clayey (till-like) soils that correspond with Medium Suitability for LID systems based on geology.

The 2012 TRCA Guideline Stormwater Management Criteria notes a preference for at least 1 metre of separation between the seasonal high groundwater table and the base of an infiltration facility. Locations with less than one metre separation are considered low suitability, moderate suitability for one to two metres of separation and high suitability for more than two metres of separation to the water table. Groundwater levels (Table B-2) at the site between March and June 2022 show the depths to shallow groundwater as follows at three monitors:

- BH22-1 water levels less than 0.4 mbgl.
- BH22-2 water levels less than 0.74 mbgl.
- BH22-3 water levels from 1.5 to 1.7 mbgl.

Groundwater monitor BH22-3 is located near Main Street. Though we cannot confirm the reasons for deeper groundwater levels at this location, storm sewers along Main Street could be a conduit for transmitting groundwater and creating a narrow cone of depression parallel to the sewers.

The geology and groundwater information available to date suggests the site has low to medium suitability for LID measures.

4.5 GROUNDWATER DISCHARGE AREAS

The previous sections of this report document groundwater levels, soils and climatic data to address groundwater recharge before and after development. The high groundwater levels at the site, low recharge rates shown in the ORMPG model, and the physical setting of the South Slope with a till cap over the Oak Ridges Moraine gave cause for further evaluation of groundwater. Figure 6 was prepared using the Oak Ridges Moraine Groundwater Program (ORMPG) to identify areas of groundwater discharge. This area of Stouffville is situated within a groundwater discharge area and essentially means groundwater recharge beneath the site does not occur or very little occurs. This seems to be consistent with the low recharge rates appearing in Figure 5.

Though the water balance evaluation shows a deficit in groundwater recharge, this is likely a mathematical result that does not address the physical setting and limitations on recharge in a discharge area. Low Impact Development measures are unlikely to be effective in adding infiltration to this physical setting and in our opinion, recharge mitigation is not required for this site.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The conclusions and recommendations presented below are based upon the data collected and reviewed as part of these investigations:

- The study area and site are located within the South Slope Physiographic Region. This physiographic region has a clayey-silty (till-like) soil matrix at the site that caps Oak Ridges Moraine sediments.
- Drainage is south to southeast along Stouffville Creek.
- Three boreholes drilled at the site confirm the presence of mostly clayey-silt to silt within the upper 6 metres of ground surface.

- The depth to groundwater ranges from about ground surface at the north end of the site to about 1.7 metres below grade near Main Street. The lower water levels near Main Street might be caused by local dewatering from existing buried infrastructure.
- The recharge rate for this site was estimated at 73 mm/year. This is within the upper range for values obtained from the Oak Ridges Moraine Groundwater Program.
- There are no known water wells within 500 metres of the site.
- The site is located outside the wellhead protection area for the Stouffville wells.
- The recharge deficit caused by hard covered surfaces post-development for this site is calculated at 113 m^3/year.
- Further review of the study area reveals the site is within a groundwater discharge area. The presence of a groundwater discharge area should preclude the need for low impact development measures for a balanced water budget at this site.
- In our opinion, there is no need for LID systems within this hydrogeologic setting.

Respectfully Submitted,
GAMAN CONSULTANTS INC.

Gary R. Hendy, P.Eng.
Consulting Engineer

6.0 LIMITATIONS AND USE

This report has been prepared for the exclusive use of 2426009 Ontario Ltd.. for the exclusive use in the evaluation of the area for the proposed development. GAMAN Consultants Inc. accepts no responsibility for any damages incurred by any third party as a result of decisions made, or actions taken based upon the information contained within this report.

All background information used in the preparation of this report has been relied upon in good faith, and GAMAN does not accept any responsibility for any mis-statements, inaccuracies, or deficiencies contained in those documents or records. The information contained in this report should be evaluated, interpreted and implemented only in the context of the assignment.

The findings and conclusions included in this report reflect our best judgement in light of the information available at the time of report preparation and site inspection and are valid only at the date of issuance. If additional information is provided in the future, such as the results of additional site-specific assessments or monitoring, GAMAN will be pleased to re-evaluate our conclusions contained within this report, and issue amendments, as required.

APPENDIX C

CLIMATIC DATA

TABLE C-1
CLIMATIC WATER BUDGET: CLIMATE NORMAL 1981-2010 (Buttonville Airport "A" ID 615HMAK)
Potential Evapotranspiration
Project: 6460 Main Street, Stouffville Water Balance (22002.00)

	Thornthwaite (1948)							
Month	Mean Temperature (^{o}C)	Heat Index	Potential Evapo-transpiration (mm)	Daylight Correction Value	Adjusted Potential Evapo-transpiration (mm)	Total Precipitation (mm)	Surplus (mm)	Deficit (mm)
January	-5.8	0.0	0.0	0.81	0.0	62.1	62.1	0.0
February	-5.6	0.0	0.0	0.81	0.0	50.5	50.5	0.0
March	-0.4	0.0	0.0	1.02	0.0	53.2	53.2	0.0
April	6.7	1.6	29.6	1.12	33.1	74.1	41.0	0.0
May	13	4.2	61.5	1.27	78.1	79.6	1.5	0.0
June	18.6	7.3	91.3	1.29	117.8	82.8	0.0	35.0
July	21.2	8.9	105.5	1.30	137.2	79.0	0.0	58.2
August	20.2	8.3	100.0	1.20	120.0	76.2	0.0	43.8
September	15.7	5.7	75.7	1.04	78.8	81.8	3.0	0.0
October	8.9	2.4	40.5	0.95	38.4	68.0	29.6	0.0
November	3.1	0.5	12.6	0.80	10.1	80.0	69.9	0.0
December	-2.9	0.0	0.0	0.74	0.0	34.2	34.2	0.0
TOTALS		38.8			613.6	821.5	345.0	137.0

TOTAL WATER SURPLUS 207.9 mm

NOTES:
1) Water budget adjusted for latitude and daylight.
2) (°C) - Represents calculated mean of daily temperatures for the month.
3) Precipitation and Temperature data from Buttonville Airport Latitude 43°51'44.00" N, Longitude 79°22'12.00" W, elevation 198 masl
4) Total Water Surplus (Thornthwaite, 1948) is calculated as total precipitation minus adjusted potential evapotranspiration.

TABLE C-2: INFILTRATION FACTORS

Project: 6460 Main Street, Stouffville Water Balance (22002.00)

MOECC 1995 Hydrogeological Technical Information Requirements (page 4-62)

Desription of Area/Development Site		Pre-development		Post-development		
TOPOGRAPHY	**Factor**	Description	Factor	Description		Factor
Flat lying, average slope < 0.6m/km	0.3	Slopes = 22m/km to 33m/km	0.1	Between Flat and Rolling		0.1
Rolling land average slope of 2.8-3.8m	0.2					
Hilly land, average slopes of 28-47 metres	0.1					
SOILS						
Tight impervious Clay	0.1	Clay and loam	0.15	Clay and loam		0.15
Medium combinations of clay and loam	0.2			Impermeable Surfaces		0
open sandy loam	0.4					
COVER						
Cultivated land	0.1	Agricultural land	0.1	Open space		0.1
Woodland	0.2					
Total Infiltration factor for pervious areas with medium combinations of clay and loam pre-development and post-development.			**0.35**	Clay and Loam		**0.35**
Total Infiltration factor for impermeable surfaces			**Not applicable**	Crushed Limestone/equiv.		**0.2**

TABLE C-3: PRE-DEVELOPMENT AND POST-DEVELOPMENT WATER BUDGETS

Project: 6460 Main Street, Stouffville Water Balance (22002.00)

PRE-DEVELOPMENT WATER BUDGET	
Water Surplus (mm/yr)	207.8
Infiltration Areas (m2)	2,468
Pre-Development Infiltration Factor	0.35
Total Recharge m3/yr	179
Total Recharge mm/yr	73
Runoff m3/year	333

POST-DEVELOPMENT RECHARGE RATES	Landscape areas	Roof top Areas	Hard cover Areas		Impervious Areas*	Totals
90% Total Precipication (mm/yr)					739	
Water Surplus (mm/yr)	207.8	207.8	207.8			
Infiltration Areas (m2)	911.0		1557		-	2468
Infiltration Factor	0.35	0.2	0.2		0	
Recharge from precipitation m3/yr	66	-	-		-	66
Runoff m3/year	123	-	2,588,357		-	2,588,480
Recharge Deficit (A-B) m3/year						113

Assumptions:

*Impervious areas include: Apartment buildings and parking areas
